

# Preparing Accessible Documents at the DTBook Format Using Free Software

**odt2dtbook: OpenOffice.org Save-as-Daisy extension**

**Dominique Archambault, Vincent Spiewak**

Université Pierre et Marie Curie – Paris 6

<http://chezdom.net/blog>

**CSUN Conference 2009**

Session OTH-1015, March 18, 3.10pm,  
Marriott - Chicago/Dallas PC Lab

# Special thanks to...

- Lenka Kasparova, SUN Microsystems
- Dennis Leas, Gh, Ilc.
- Donal Fitzpatrick, DCU
- Klaus Miesenberger, JKU
- Arthur Karshmer, Computer Science  
Guru, USF

# Brief summary of the session

- Accessible documents
- OpenOffice.org and odt2dtbook
- Practicle work today:
  - Prepare the document
  - Create the DTBook
  - Let's try with a Daisy player (gh PLAYER)
- Summary and conclusion

# What is an accessible document?

An accessible document is a document which can be accessed by anyone, regardless the modality she/he needs to use.

- Especially, but not only, non visual modalities.
- So print disabled people can use it!

# Main constraints (1)

Every piece of information that cannot be directly displayed in any modality, or automatically converted to be displayed in any modality, must have an alternate content.

## Main constraints (2)

It must contain explicitly the structure.

## What for ?

- Exchange documents with people having or not a print disability
- Deliver documents to pupils, according to the US IDEA for instance
- Store documents on a digital library for print disabled people
- and probably more...

# The DTBook format

- **DTBook** is an accessible format adopted as an **ANSI/NISO** standard (**Z39.86**), and widely used all over the world:
  - Lots of digital libraries for the blind (TPB, US Library of Congress, BrailleNet, etc)
  - NIMAS format (in the framework of IDEA)
- It is maintained by the **DAISY consortium** as part of the DAISY format.

# How to create DTBooks

- Typing manually in XML! . . . NOT! ;-)
- Daisy Authoring Software
  - See <http://daisy.org>  
section Tools: Authoring/Production Tools
- Using a word processor with Save-as-Daisy function
  - One commercial Office suite as one
  - Odt2dtbook enables OOo to create DTBooks

# OpenOffice.org and odt2dtbook

- A completely free solution to author DTBook documents!
- Both are Open Source software
- Both are cross platform

<http://openoffice.org>

<http://odt2dtbook.sf.net>

# Why OOo is relevant for creating accessible contents?

- The Open Document format (ODF) now includes all necessary features for accessibility
- OOo 3.0 is accessible, see:  
<http://wiki.services.openoffice.org/wiki/Accessibility>
- OOo allows to open a large variety of formats
- OOo is Open Source so it's easy to develop an import filter for another format
- OOo is cross platform (Linux, Mac, Win, Solaris)

# What accessible contents?

- Accessible odt files
- Accessible Web pages
  - Save as HTML document
- Accessible PDFs
  - Export to PDF
- **DTBooks!**
  - Export to DAISY (odt2dtbook)

# odt2dtbook

- odt2dtbook is an OpenOffice.org writer extension, enabling OOo to export to DTBook XML 3.
- OpenSource software (GNU LGPL 3)
- Developed in 2008 in UPMC – Paris 6
- Received a Gold Award from the OOo Community Innovation Program sponsored by SUN Microsystems

# odt2dtbook's features (1)

- Completely cross platform, it can be installed in any OpenOffice.org, version > 3.0
- odt2dtbook supports:
  - most of the DTBook elements (mapping from OOo styles).
  - page numbering (including advanced page numbering)
  - notes (end notes, rear notes), table of contents, multilingual documents.

## odt2dtbook's features (2)

- odt2dtbook supports:
  - Maths contents conforming to the MathML Modular extension of DTBook.
  - Alternative contents, production notes
  - Advanced DAISY elements (Front Matter, rear matter etc)
  - Metadata
  - etc.

# Integration with Daisy

Odt2dtbook allows to create fully functional DAISY books :

- compatibility has been ensured with the DAISY pipeline.

# Let's start practical work!

- Quick overview: let's create a new document from scratch:

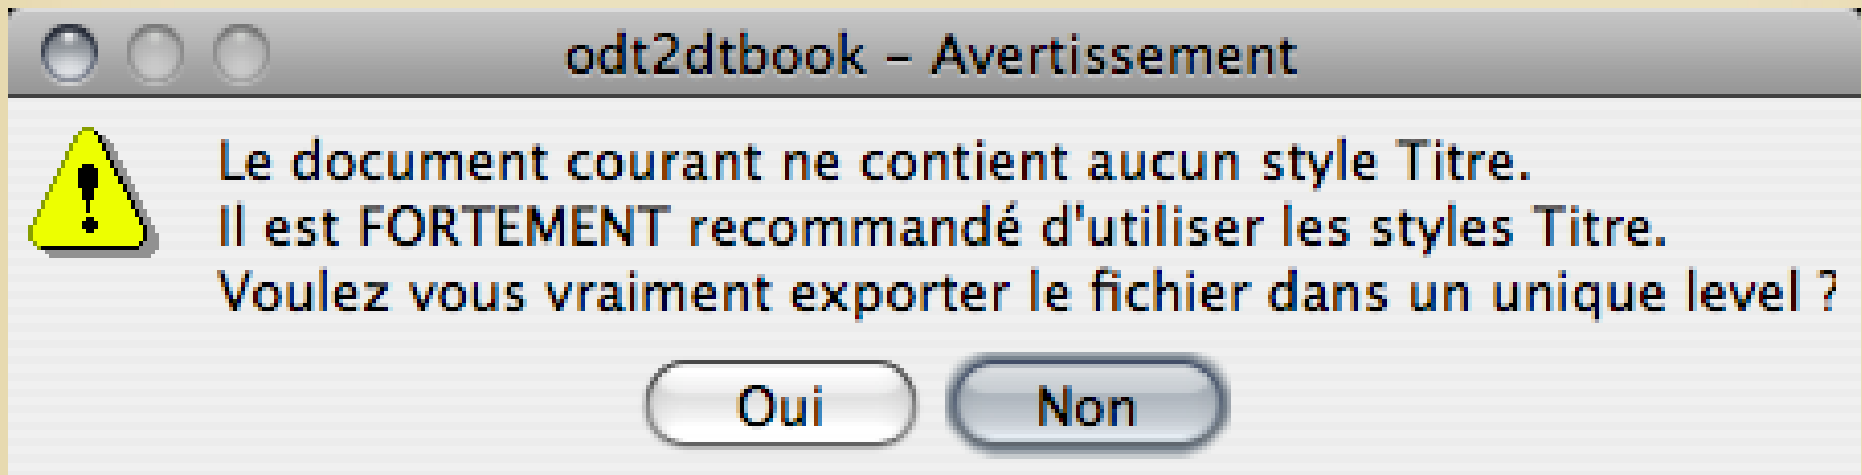

→ **File/New/Text document**

- Write a couple of “blah blah” lines
- Generate a DAISY file:

→ **File/Export as Daisy**

## What's happening now?

# A mean warning!

Odt2dtbook - Warning

Current document has no Heading Style.  
It's **STRONGLY** recommended to use Headings Styles.  
Do you really want exporting in one unique level?

## OK, Cancel

# but why do I have this warning?

## Let's improve this!

- Add a few lines like this →
- Set the styles of headings to the relevant OOo styles
- Now let's do the **Export as Daisy** again

**Heading of level 1**

blah blah blah blah

**Other heading of level 1**

*Heading of level 2*

bluh bluh bluh

*Second heading of level 2*

bloh bloh bloh

**Next heading of level 1**

blih blih blih blih

# odt2dtbook Export Dialog

DAISY DTBook Translator

UID: e76927b2-66b3-45f6-9d4a-216a9

Title: A DAISY Book

Creator: Vincent Spiewak

Publisher: Vincent Spiewak

Language: en-US

include page numbers

use alternate level markup

include CSS

Translate Cancel

Identification of the document

Creator of the DTBook

The CSS allows the user to view the DTBook within a simple browser

Title of the DTBook

**Tools > Options**  
**> OpenOffice.org > User Data**  
**> First Name (and Last Name)**

Identification  
of the document

Creator of  
the DTBook

The CSS allows the

Title of the  
DTBook

**File > Properties**  
**> Description > Title**

## Now let's access this document

- We will propose use a software Daisy reader:

- gh PLAYER™ (developed by gh, llc.)

<http://www.gh-accessibility.com>

# gh PLAYER™

gh PLAYER™ is a software reading system designed for reading NIMAS, DAISY Digital Talking Books, and plain text files while providing multiple sensory output.

It supports:

- high contrast large text
- recorded or synthesized speech
- Braille output to a refreshable display

# gh PLAYER™ keyboard commands

- Start the PLAYER or Return to PLAYER's Starting Screen.....Ctrl+Alt+G
- Exit the PLAYER.....Ctrl+Q or Alt+F4
- Open Book.....Ctrl+O
- Close Book.....Ctrl+W
- Stop PLAYER Voice .....Ctrl
- Stop/Start Narrator Voice .....Spacebar

# gh PLAYER™ keyboard commands

## Navigation

- Next Part.....Right Arrow
- Previous Part.....Left Arrow
- Change Navigation Mode in TTS  
(Word, Segment, Section, Page).....Up/Down Arrows
- Change Navigation Mode in RA  
(Time, Segment, Section, Page).....Up/Down Arrows
- Go to Beginning of Book .....Ctrl+Home
- Go to End of Book .....Ctrl+End

# A more complex document

- Let's create a document using a template
  - **File/New/Templates and Documents**
    - > **DaisyDTBook**
    - Choose "Empty DTBook"**
- Now you will have a set of specific DAISY styles

# Let's get some contents

- For instance let's use some online content from wikipedia:

<http://en.wikipedia.org/wiki/Eggplant>

- Use any other content if you don't like eggplants (I think they are delicious!)
- Or: use your own contents

*Select contents with headings,  
lists, images, etc...*

# Levels

- Levels are mapped with Heading1, Heading2,... HeadingX Styles.
- Headings markup **MUST** be consistent:  
you cannot have a Heading 3 just after an Heading 1.
- Use alternate level markup (in the export dialog box) if more than 7 levels are used.

**<levelX>** vs **<level depth="X">**

# Images

- Images are supported natively, insert an image with:

**Insert > Picture > from File...**

- They will be outputted in an "images/" directory (if the "link" box remains unchecked)
- Insert the alternate text using

**Picture ... > Options > Alternate (text only)**

(right-click on the picture)

# Tables

- Use simple tables ! Avoid nested tables.
- Use Heading lines (there is a “Heading” box in the “Options” when a table is created)
- Use the style “Table heading” for the content of the heading line

# Lists

This is a list:

- Linux
  - Debian
  - Ubuntu
- Solaris
- Mac OS X
- Windows

This is not<sup>1</sup>:

- \* Linux
  - Debian
  - Ubuntu
- \* Solaris
- \* Mac OS X
- \* Windows

1: starts and dashes were inserted manually here

# Lists

This is a list:

- Linux
  - Debian
  - Ubuntu
- Solaris
- Mac OS X
- Windows

This is not<sup>1</sup>:

- \* Linux
  - Debian
  - Ubuntu
- \* Solaris
- \* Mac OS X
- \* Windows

Ordered lists are fine too!

# Tasks

- Copy a few sections, with titles and paragraphs
  - Insert one of the images
- In the paragraphs "History"
  - Insert the 2 first notes of 'History'
- In the paragraph "Synonyms"
  - Make a bullet list from the various synonyms
- In the paragraph "Statistics"
  - Include the table (don't forget the headings)

## To finish

- Now I'll show how to generate a Full Daisy book, using our generated DTBook and the Daisy pipeline

<http://www.daisy.org/projects/pipeline>

# Summary and Conclusion

- We have seen how to easily create a DTBook file with `Ooo+odt2dtbook`
- The method can be generalised to create an accessible ODT file for any purpose
- This can be done exactly the same on other platforms, and the resulting files can be used on any platforms (as well the odt and the DTBook)

## OOo + odt2dtbook

The only rich, cross-platform, accessible, free and open source environment for authoring DAISY books, which is a tremendous addition to the disability community

<http://odt2dtbook.sf.net>

# Ooo + odt2dtbook can be used:

- by libraries for the blind to convert documents to DTBook
- by teachers to create NIMAS documents
- by resource centres who produce accessible documents for the print impaired in schools and universities
- By any print disabled user to create a DTBook
- By anybody to create a full Daisy book (together with the Daisy pipeline)

# If you are interested in Daisy and OpenSource

You could attend the session OTH-2045:

Open Source Software for DAISY – Today  
and in the Future

by Markus Gylling, George Kerscher, Dominique  
Archambault

Friday, March 20 – 10.40am

Marriott – Meridian One DAISY/EASY
